

QA-Deployment with K8S

How to deploy multiple QA environments with the help of K8s (K3s)

Jan Baer, LeadDeveloper, CHECK24

15. September 2020

- Comparison for insurances - 2 different products, separate desktop and mobile apps
- Backoffice apps
- Administration apps
- Node.js, Next.js, Docker
- 5 Developers, 2 QA-Engineers, 3 Productmanagers

The screenshot shows the CHECK24 website interface for a 'Berufsunfähigkeit Vergleich' (Disability Insurance Comparison). The header includes the CHECK24 logo, a search icon, the phone number '089 - 24 24 12 66', and links for 'Hilfe und Kontakt' and 'Mein Konto'. The main heading is 'Berufsunfähigkeit Vergleich'. Below this, there's a section for 'Persönliche Angaben' (Personal Information) with a red banner indicating '50 € Shopping-Gutschein - bis 24.09.'. The form includes fields for 'Berufliche Situation' (with radio buttons for 'Angestellter oder Selbständiger', 'Beamter', and 'Andere (z.B. Student)'), 'Beruf' (with a text input 'Bitte aktuellen Beruf eingeben'), 'Höchster Bildungsabschluss' (with a dropdown 'Bitte wählen'), and 'Geburtsdatum' (with a text input 'TT.MM.JJJJ'). To the right of the form, there's a sidebar with information about the user's situation and its impact on the tariff rate, with numbered steps 1, 2, and 3. The sidebar text explains that the user's situation affects the tariff rate and provides definitions for 'Angestellter oder Selbständiger', 'Beamter', and 'Andere (z.B. Student)'. The form also has a link for 'optionale Angaben' (optional information) at the bottom.

What we had before

- 3 QA environments
- 3 cloned Bamboo plans for deployment
- 3 configuration files for each project with fixed host-urls (qa1, qa2, qa3)
- Docker-compose with 68 running containers on each host machine
- HAProxy for routing (no loadbalancing)
- Very difficult to add more QA environments
- Hard to investigate when a feature was not deployed correctly
- Docker images tagged with **verbu-12345_latest**

QA Deployment

QA1 VERBU-6224

Build #1283

Progress: 100%

Time: 3 Minutes and 2 seconds

Status: **Successful**

Assigned to

Assigned today at 09:28

UN-ASSIGN

VERBU-JIRA number

↓ DEPLOY TO QA1

QA2 VERBU-6051

Build #1203

Progress: 100%

Time: 2 Minutes and 30 seconds

Status: **Successful**

Environment free

ASSIGN TO ME

VERBU-JIRA number

↓ DEPLOY TO QA2

QA3 VERBU-6166

Build #1254

Progress: 100%

Time: 2 Minutes and 18 seconds

Status: **Successful**

Environment free

ASSIGN TO ME

VERBU-JIRA number

↓ DEPLOY TO QA3

- At least 6 parallel QA environments
- Easier scalable if necessary
- Only one config for all QA environments
- Better management and error investigation

QA Deployment

VERBU-JIRA number

CREATE NEW DEPLOYMENT

- Cockpit - provides a lot of functionalities for our daily workflows with Testing and Deployment
- QA-K8S-Service - Micro-Service with endpoints for creating, updating, and deleting qa-deployments

What external services we're using

- Nexus Docker Registry
- Rancher - Kubernetes Management Platform
- K3s - Lightweight Kubernetes Distribution

How is it working together

- Using officially-supported Kubernetes client libraries - [Link](#)
- Using REST api directly - [Link](#)
 - Tip: run `kubectl ... -v 8` to see the rest requests for each command
- Using Rancher api for extended features - [Link](#)

K3s is a fully compliant Kubernetes distribution with the following enhancements:

- Packaged as a single binary. (less than 100 MB.)
- Lightweight storage backend based on sqlite3 as the default storage mechanism. etcd3, MySQL, Postgres also still available.
- Wrapped in simple launcher that handles a lot of the complexity of TLS and options.
- Secure by default with reasonable defaults for lightweight environments.

- Simple but powerful “batteries-included” features have been added, such as: a local storage provider, a service load balancer, a Helm controller, and the Traefik ingress controller.
- Operation of all Kubernetes control plane components is encapsulated in a single binary and process. This allows K3s to automate and manage complex cluster operations like distributing certificates.
- External dependencies have been minimized (just a modern kernel and cgroup mounts needed).

- Containerd
- Flannel
- CoreDNS
- CNI
- Host utilities (iptables, socat, etc)
- Ingress controller (traefik)
- Embedded service loadbalancer
- Embedded network policy controller

- Uses per default Containerd as container-engine
- Can use alternatively Docker, but it's not required
- Run's as a Server and a Node on the same machine
- But also as Server(s) and Node(s) on separate machines
- You need at least one Server and one Node
- For high availability K3s supports a cluster of multiple servers

The architecture of K3s

Install K3s is very easy

Install the server

```
3 K3S_DATA_DIR=/data/k3s ↵
4 ↵
5 export K3S_KUBECONFIG_MODE=644 ↵
6 export K3S_TOKEN="qa-k3s-cluster-1" ↵
7 ↵
8 export INSTALL_K3S_EXEC="server --docker --data-dir ${K3S_DATA_DIR}"
9 ↵
10 curl -sL https://get.k3s.io | sh - ↵
```

Install the agent

```
export K3S_TOKEN="qa-k3s-cluster-1" ↵
↵
K3S_URL="https://10.10.10.1:6443" ↵
K3S_DATA_DIR=/data/k3s ↵
↵
export INSTALL_K3S_EXEC="agent --server ${K3S_URL} --data-dir ${K3S_DATA_DIR} --docker"
↵
curl -sL https://get.k3s.io | sh ↵
```

K3s will be installed as Systemd service

Server

```
• k3s.service - Lightweight Kubernetes
  Loaded: loaded (/etc/systemd/system/k3s.service; enabled; vendor preset: enabled)
  Active: active (running) since Sat 2020-07-11 12:32:12 CEST; 2 weeks 2 days ago
    Docs: https://k3s.io
  Main PID: 1232 (k3s-server)
    Tasks: 0
   CGroup: /system.slice/k3s.service
           └─1232 /usr/local/bin/k3s server --docker --node-label agent-type=server --data-dir /data/k3s
```

Agent

```
• k3s-agent.service - Lightweight Kubernetes
  Loaded: loaded (/etc/systemd/system/k3s-agent.service; enabled; vendor preset: enabled)
  Active: active (running) since Fri 2020-07-24 15:50:56 CEST; 3 days ago
    Docs: https://k3s.io
  Main PID: 1328 (k3s-agent)
    Tasks: 0
   CGroup: /system.slice/k3s-agent.service
           └─1328 /usr/local/bin/k3s agent --docker --node-label agent-type=worker --data-dir /data/k3s
```

The whole K3s cluster

<input type="checkbox"/> State	Name	Roles	Version	CPU	RAM	Pods
<input type="checkbox"/> Active	bu-int-k8s-node-01 172.30.136.197 <small>agent-type=worker</small>	Worker	v1.18.3-k3s1 <small>19.3.11</small>	0.9/4 Cores	1.7/7.8 GiB	36/110
<input type="checkbox"/> Active	bu-int-k8s-node-02 172.30.136.198 <small>agent-type=worker</small>	Worker	v1.18.3-k3s1 <small>19.3.11</small>	0.9/4 Cores	1.6/7.8 GiB	34/110
<input type="checkbox"/> Active	bu-int-k8s-node-03 172.30.136.199 <small>agent-type=worker</small>	Worker	v1.18.3-k3s1 <small>19.3.11</small>	0.9/4 Cores	1.1/7.8 GiB	24/110
<input type="checkbox"/> Active	bu-int-k8s-node-04 172.30.136.200 <small>agent-type=worker</small>	Worker	v1.18.3-k3s1 <small>19.3.11</small>	0.8/4 Cores	1.7/7.8 GiB	37/110
<input type="checkbox"/> Active	bu-int-k8s-node-05 172.30.136.205 <small>agent-type=worker</small>	Worker	v1.18.3-k3s1 <small>19.3.11</small>	0.6/4 Cores	1/7.8 GiB	23/110
<input type="checkbox"/> Active	bu-int-k8s-server-01 172.30.136.196 <small>agent-type=server</small>	Control Plane	v1.18.3-k3s1 <small>19.3.11</small>	0.1/2 Cores	0.1/3.9 GiB	7/110

What's is the role of Rancher

- Makes the access to the cluster easier. (UserManagement, AccessToken)
- Provides additional REST endpoints for creating namespace and querying workloads
- Can configure monitoring with Prometheus and Grafana
- Works fine together with K3s because it's from the same company
- Easy version upgrades for the K3s cluster with the system-upgrade-controller
- Easier access to container logs and analyzing deployment problems

What problems we had to solve

- Dynamic creation of urls
- Improve first-deployment and update and cleanup times
- Waiting for depending services (NSQ)
- Find the right limits
- Rewriting urls
- Updating deployments

Dynamic creation of urls

Use placeholders in config files, processing with bu.config npm module when Node.js server starts

```
{
  "env": "qa",
  "origin": "https://services-${feature}.qa.bu.check24-test.de",
  "services": {
    "auth": "https://services-${feature}.qa.bu.check24-test.de/auth",
    "ripple": "https://services-${feature}.qa.bu.check24-test.de/ripple",
    "miami": "https://services-${feature}.qa.bu.check24-test.de/miami",
    "customerActivities": "https://services-${feature}.qa.bu.check24-test"
  },
}
```

Set feature as environment variable

Environment Variables	
Environment Variables that were added at creation.	
Key	Value
NODE_MAX_PROCESSES	1
NODE_ENV	qa
FQDN	services-verbu-6202.qa.bu.check24-test.de
FEATURE	verbu-6202

Improve deployment times

- First deployment takes a while because it requires to deploy ~70 Pods
- Only update what has changed

Feature: VERBU-6202 (active) Created on: 23.07.2020 16:53 (vor 4 Tagen) Created by: [UPDATE DEPLOYMENT](#) [REMOVE DEPLOYMENT](#)

ipent	nexus.intern.bu.check24.de:5000/docker/ipent:VERBU-6202_latest	restartCount: 0	status: updating
mobile-app	nexus.intern.bu.check24.de:5000/docker/mobile-app:VERBU-6202_latest	restartCount: 0	status: updating
bulu	nexus.intern.bu.check24.de:5000/docker/bulu:VERBU-6202_latest	restartCount: 0	status: updating
wallet	nexus.intern.bu.check24.de:5000/docker/wallet-master_latest	restartCount: 0	status: active
u-flipper	nexus.intern.bu.check24.de:5000/docker/u-flipper-master_latest	restartCount: 0	status: active

- No graceful shutdown reduces deletion time (not recommended for Production)

```
terminationGracePeriodSeconds: 0
```

Waiting for dependent services

- Some of the services requiring a running NSQ service

```
<%·if·(.requiresNsqs·){·%>␣  
initContainers:␣  
···name:·wait-for-nsq␣  
···image:·subfuzion/netcat␣  
···command:·['sh',·'-c',·"while·!·nc·-z·nsqd·4151;·do·sleep·0.5;·done"]␣  
<%·}·%>␣
```

State ↕	Name ↕	Image ↕	Restarts ↕
Waiting PodInitializing	brain	nexus.intern.bu.check24.de:5000/docker/brainmaster_latest	0 ⓘ
Waiting PodInitializing	wait-for-nsq Init Container	subfuzion/netcat	! ⓘ

Finding the right limits

- Observe a deployment to learn what resources are required

```
+ ~  
→ watch -n 2 -t kubectl top pods -n verbu-6202
```

NAME	CPU(cores)	MEMORY(bytes)
accounting-api-5588fc9678-pd57h	2m	65Mi

consulting-process-api-549fcb8986-r8zzb	5m	66Mi

- Remove `/eventbus` from the url before forwarding to NSQ service

```
apiVersion: networking.k8s.io/v1beta1
kind: Ingress
metadata:
  annotations:
    kubernetes.io/ingress.class: traefik
    traefik.frontend.rule.type: PathPrefixStrip
  name: ingress-eventbus
  namespace: <%= namespace %>
spec:
  rules:
    - host: <%= host %>
      http:
        paths:
          - backend:
              serviceName: <%= name %>
              servicePort: <%= port %>
            path: <%= path %>
        tls:
          - hosts:
              - <%= host %>
            secretName: qa-bu-ssl-certificate
```

Updating deployments

- How updating deployments when Docker image tags won't be changed
- Use an artificial deployment-id that will be changed for each deployment

```
metadata:
  labels:
    app: <%= name %>
    environment: <%= environment %>
    <% if (type == 'system') { %>
    deploymentId: <%= deploymentId %>
    <% } %>
```

Which problems we still have

- Too many pods for every feature deployment (6 x 70)
- Deployment becomes unstable after the 6th deployment and it's unclear why

- Improve visualization of the deployment state
- Automatic cleanup when ticket is released
- Detecting when no further deployments are possible
- One MongoDB per feature deployment
- Show Dockerlogs from Cockpit to investigate problems

Questions?

Thank you!
